

YEAST FERMENTATION TREATED BANANA PEEL FEEDING TECHNOLOGY

This method is a tasty and nutritious method for feeding.

Preparation (material)

A. Banana peel 50kg

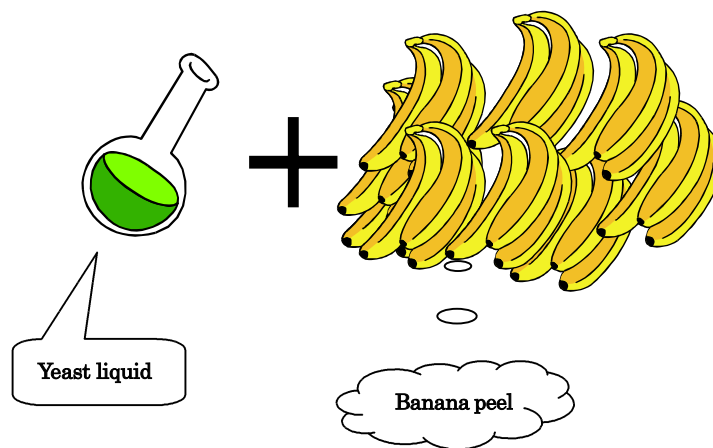

B. Yeast 20-50g

C. Water 1 liter

Directions:

- 1). Dissolve yeast with water.
- 2). Mix banana peeling with yeast liquid.
- 3). Keep the banana peeling in cool place. Avoid exposing it under the sun.
- 4). After 2-3 days, this solution is available as feeding.

Banana peel includes a high percentage of starch. Starch is fermented by the yeast treatment. This method is vice-production using. All types of vice-production is low-level nutrition. However, this will become good-taste for dairy animals. And protein level also will be up little percentage rather than no treatment. So when you use banana peel as feeding, you had better treat with yeast fermentation.
