

Table of Contents

Prefaces

I. Compressible Fluids

1. Qualitative differences between linear and nonlinear waves
- A. General Equations of Flow. Thermodynamic Notions.**
2. The medium
3. Ideal gases, polytropic gases, and media with separable energy
4. Mathematical comments on ideal gases
5. Solids which do not satisfy Hooke's law
6. Discrete media
7. Differential equations of motion
8. Conservation of energy
9. Enthalpy
10. Isentropic flow. Steady flow. Subsonic and supersonic flow
11. Acoustic approximation
12. Vector form of the flow equations
13. Conservation of circulation. Irrotational flow. Potential
14. Bernoulli's law
15. Limit speed and critical speed

B. Differential Equations for Specific Types of Flow

16. Steady flows
17. Non-steady flows
18. Lagrange's equations of motion for one-dimensional and spherical flow

Appendix – Wave Motion in Shallow Water

19. Shallow water theory

II Mathematical Theory of Hyperbolic Flow Equations for Functions of Two Variables

20. Flow equations involving two functions of two variables
21. Differential equations of second order type
22. Characteristic curves and characteristic equations
23. Characteristic equations for specific problems
24. The initial value problem. Domain of dependence. Range of influence
25. Propagation of discontinuities along characteristic lines
26. Characteristic lines as separation lines between regions of different types
27. Characteristic initial values
28. Supplementary remarks about boundary data
29. Simple waves. Flow adjacent to a region of constant state
30. The hodograph transformation and its singularities
31. Systems of more than two differential equations

Appendix

32. General remarks about differential equations for

I. INTRODUCTION

1. Qualitative differences between linear and non-linear waves
2. The medium
3. Differential equations of motion
4. Remarks on the thermodynamical relations
5. Irrotational flow. Steady flow. Bernoulli's law
6. Various forms of the differential equations
7. Lagrange's equations of motion for one-dimensional flow

II. MATHEMATICAL THEORY OF ISENTROPIC FLOWS DEPENDING ON TWO INDEPENDENT VARIABLES

8. The differential equations
9. Characteristic parameters
10. Initial value problem. Domain of dependence. Range of influence
11. Propagation of discontinuities along characteristic lines
12. Characteristic lines as separation lines between regions of different types of flow
13. Characteristic initial values
14. Relation between the characteristics in the x,y -plane and in the u,v -plane
15. Application to the differential equations of gas dynamics
16. Flow adjacent to a region of constant state. Simple waves

III. MOTION IN ONE DIMENSION

A. Integration of the Differential Equations

- 17. Introductory remarks
- 18. Solution of the differential equations
- 19. Simple waves

B. Continuous Motion. Simple Waves

- 20. Rarefaction waves
- 21. Centered rarefaction waves
- 22. Explicit formulas for centered rarefaction waves
- 23. Remark on centered simple waves in Lagrangean coordinates
- 24. Compression waves
- 25. Position of envelopes for compression waves

C. Shock Fronts

- 26. Introduction
- 27. Shock wave in a tube
- 28. Shock conditions
- 29. Contact discontinuities
- 30. Description of shocks
- 31. Models of shock motion
- 32. Mechanical shock conditions
- 33. Cases in which the first two shock conditions are sufficient to determine the shock
- 34. Shock relations derived from the differential equations for viscous and heat-conducting fluids
- 35. Critical speed and Prandtl's relation for polytropic gases
- 36. Relations referring to the strength of a shock for polytropic gases
- 37. Change in entropy
- 38. The state on one side of the shock front determined by the state on the other side
- 39. Geometric representations of shock transitions for polytropic gases
- 40. Shock conditions in Lagrangean representation
- 41. Shock in a uniform compressive motion
- 42. Reflection of a shock on a rigid wall
- 43. Non-uniform shocks

functions of more than two independent variables.
Characteristic surfaces

III. One-Dimensional Flow

- 33. Problems of one-dimensional flow

A. Continuous Flow

- 34. Characteristics
- 35. Domain of dependence. Range of influence
- 36. More general initial data
- 37. Riemann invariants
- 38. Integration of the differential equations of isentropic flow
- 39. Remarks on the Lagrangian representation

B. Rarefaction and Compression Waves

- 40. Simple waves
- 41. Distortion of the wave form in a simple wave
- 42. Particle paths and cross-characteristics in a simple wave
- 43. Rarefaction wave
- 44. Escape speed. Complete and incomplete rarefaction waves
- 45. Centered rarefaction waves
- 46. Explicit formulas for centered rarefaction wave
- 47. Remark on simple waves in Lagrangian coordinates
- 48. Compression waves

Appendix to Part B

- 49. Position of the envelope and its cusp in a compression wave

C. Shocks

- 50. The shock as an irreversible process
- 51. Historical remarks on non-linear flow
- 52. Discontinuity surfaces
- 53. Basic model of discontinuous motion. Shock wave in a tube
- 54. Jump conditions
- 55. Shocks
- 56. Contact discontinuities
- 57. Description of shocks
- 58. Models of shock motion
- 59. Discussion of the mechanical shock conditions
- 60. Sound waves as limits of weak shocks
- 61. Cases in which the mechanical shock conditions are sufficient to determine the shock
- 62. Shock conditions in lagrangian representation
- 63. Shock relations derived from the differential equations for viscous and heat-conducting fluids
- 64. Hugoniot relation. Determinacy of the shock transition
- 65. Basic properties of the shock transition
- 66. Critical speed and Prandtl's relation for polytropic gases

- 67. Shock relations for polytropic gases
- 68. The state on one side of the shock front in a polytropic gas determined by the state on the other side
- 69. Shock resulting from a uniform compressive motion
- 70. Reflection of a shock on a rigid wall
- 71. Shock strength for polytropic gases
- 72. Weak shocks. Comparison with transitions through simple waves
- 73. Non-uniform shocks
- 74. Approximate treatment of non-uniform shocks of moderate strength
- 75. Decaying shock wave. N-wave
- 76. Formation of a shock
- 77. Remarks on strong non-uniform shocks

D. Interactions

- 44. Introduction. General types of problems
- 45. Decaying shock wave
- 46. Piston motion and interactions
- 47. Summary of results on elementary interactions
- 48. Method of analysis
- 49. The process of penetration

Appendix 1. DETONATION WAVES

- 50. Detonation conditions
- 51. Auxiliary hypothesis

Appendix 2 WAVE PROPAGATION IN ELASTIC-PLASTIC MATERIAL

- 52. The medium
- 53. The equation of motion
- 54. Impact loading
- 55. Stopping shocks
- 56. Interactions and reflections

Appendix 3 WAVE MOTION IN OPEN CHANNELS

- 57. WAVE MOTION IN OPEN CHANNELS

D. Interactions

- 78. Typical interactions
- 79. Survey of results
- 80. Riemann's problem. Shock tubes
- 81. Method of analysis
- 82. The process of penetration for rarefactive wave
- 83. Interactions treated by the method of finite differences

E. Detonation and Deflagration Waves

- 84. Reaction processes
- 85. Assumptions
- 86. Various types of processes
- 87. Chapman-Jouguet processes
- 88. Jouguet's rule
- 89. Determinacy in gas flow involving a reaction front
- 90. Solution of flow problems involving a detonation process
- 91. Solution of flow problems involving deflagrations
- 92. Detonation as a deflagration initiated by a shock
- 93. Deflagration zones of finite width
- 94. Detonation zones of finite width. Chapman-Jouguet hypothesis
- 95. The width of the reaction zone
- 96. The internal mechanism of a reaction process. Burning velocity

Appendix - Wave Propagation in Elastic-Plastic Material

- 97. The medium
- 98. The equations of motion
- 99. Impact loading
- 100. Stopping shocks
- 101. Interactions and reflections

IV. Isentropic Irrotational Steady Plane Flow

- 102. Analytical background

A. Hodograph Method

- 103. Hodograph transformation
- 104. Special flows obtained by the hodograph method
- 105. The role of limiting lines and transition lines

IV. ISENTROPIC IRROTATIONAL STEADY PLANE FLOW. OBLIQUE SHOCK FRONTS. SHOCK REFLECTION.

58. Introduction

A. Continuous Motion. Simple Waves

59. Characteristics. The Mach angle

60. Simple waves. Epicycloidal shape of the characteristics Γ

61. Flow around a bend or corner

62. Compression waves

63. Interaction of simple waves

64. Jets

B. Oblique Shock Fronts

65. Flow in a corner. Oblique shocks. Qualitative description

66. Shock conditions in more than one dimension. Contact discontinuities

67. Conditions for shocks in polytropic gases

68. Geometrical representation of transitions through oblique shocks in two dimensions

69. The shock polar

70. Discussion of oblique shocks by means of the shock polar

C. Configurations with Several Oblique Shock Fronts. Shock Reflection

71. Regular reflection of a shock wave on a rigid wall

72. Mach reflection. Experimental facts. Mathematical problem

73. Algebraic framework

74. Analysis by graphical methods

75. Comparison between regular and Mach reflection

76. Pressure relations

77. Modifications and generalizations

B. Characteristics and Simple Waves

106. Characteristics. Mach lines and Mach angle

107. Characteristics in the hodograph plane as epicycloids

108. Characteristics in the (u,v) -plane continued

109. Simple waves

110. Explicit formulas for streamlines and cross Mach lines in a simple wave

111. Flow around a bend or corner. Construction of simple waves

112. Compression waves. Flow in a concave bend and along a bump

113. Supersonic flow in a two-dimensional duct

114. Interaction of simple waves. Reflection on a rigid wall

115. Jets

116. Transition formulas for simple waves in a polytropic gas.

C. Oblique Shock Fronts

117. Qualitative description

118. Relations for oblique shock fronts. Contact discontinuities

119. Shock relations in polytropic gases. Prandtl's formula

120. General properties of shock transitions

121. Shock polars for polytropic gases

122. Discussion of oblique shocks by means of shock polars

123. Flows in corners or past wedges

D. Interactions - Shock Reflection

124. Interactions between shock's. Shock reflection

125. Regular reflection of a shock wave on a rigid wall

126. Regular shock reflection continued

127. Analytic treatment of regular reflection for polytropic gases

128. Configurations of several confluent shocks. Mach reflection

129. Configurations of three shocks through one point

130. Mach reflections

131. Stationary, direct and inverted Mach configuration

132. Results of a quantitative discussion

133. Pressure relations

134. Modifications and generalizations

135. Mathematical analysis of three-shock configuration

136. Analysis by graphical methods

E. Approximate Treatments of Interactions. Airfoil Flow

137. Problems involving weak shocks and simple waves

138. Comparison between weak shocks and simple waves

139. Decaying shock front

140. Flow around a bump or an airfoil

141. Flow around an airfoil' treated by perturbation methods (linearization)

142. Alternative perturbation method for airfoils

F. Remarks about Boundary Value Problems for Steady Flow

143. Facts and conjectures concerning boundary conditions

V. Flow in Nozzles and Jets

144. Nozzle flow

145. Flow through cones

146. De Laval nozzle

147. Various types of nozzle flow

148. Shock patterns in nozzles and jets

149. Thrust

150. Perfect nozzles

VI. Flow in Three Dimensions

A. Steady Flow with Cylindrical Symmetry

151. Cylindrical symmetry. Stream function

152. Supersonic flow along a slender body of revolution

153. Resistance

B. Conical Flow

154. Qualitative description

155. The differential equations

156. Conical shocks

157. Other problems involving conical flow

C. Spherical Waves

158. General remarks

159. Analytical formulations

160. Progressing waves

161. Special types of progressing waves

162. Spherical detonation and deflagration waves

164. Other spherical quasi-simple waves

165. Reflected spherical shock fronts

166. Concluding remarks

Bibliography

Index of Symbols

Subject Index

V. FLOW IN THREE DIMENSIONS

78. Introduction

A. Flow in Nozzles and Jets

79. Nozzle flow

80. Flow through cones

81. De Laval's nozzle

82. Various types of nozzle flow

83. Shock patterns in nozzles and jets

84. Thrust

85. Perfect nozzles

B. Conical Flow

86. Qualitative description

87. The differential equations

88. Conical shocks 259

C. Spherical Waves

89. General remarks

90. Analytical formulations

91. Special solutions

92. Discussion of special cases
